Abstract:

This report contains the details of the tasks of Assignment 3 of Compilers course (mainly output for each input test cases). We have developed a Parser for C language which makes use of the C lexer to parse the given C input file. We used lexer to convert the input code into a stream of tokens which was provided to the parser. Parser matches the stream with the defined productions of the language. We used look-ahead for checking errors in comments and some other lexical errors. But lexical analyzer cannot detect errors in the structure of a language (syntax), unbalanced parenthesis etc. These errors are handled by a parser. But in syntax analysis phase, we don't check if the input is semantically correct. After parser checks if the code is structured correctly, semantic analysis phase checks if that syntax structure constructed in the source program derives any meaning or not. The output of the syntax analysis phase is parse tree whereas that of semantic phase is annotated parse tree.

We have mentioned some of the semantics errors that the semantic analyzer is expected to recognize:

- 1. Declaration of keyword/identifier as variable name.
- 2. New declarations don't conflict with earlier defined declarations
- 3. Break/continue statements only appear within loops
- 4. Actual and formal parameter mismatch.
- 5. Arithmetic operations require integers/ same data types.

The source code is also available on the GitHub repository of Amber Bhanarkar (BT17CSE022)

https://github.com/amberbhanarkar/Semantic-Analyzer

Explanation:

The lex code is detecting the tokens from the source code and returning the corresponding token to the parser. We are using the symbol table and constant table. We have used functions like insertSTnest(), insertSTparamscount(), checkscope(), deletedata(), duplicate() etc., in order to check the semantics. In the production rules of the grammar semantic actions are written and these are performed by the functions listed above.

Declaration Section

In this section we have included all the necessary header files, function declaration and flag that was needed in the code. Between declaration and rules section we have listed all the tokens which are returned by the lexer according to the precedence order. We also declared the operators here according to their associativity and precedence. This ensures the grammar we are giving to the parser is unambiguous as LALR(1) parser cannot work with ambiguous grammar.

Rules Section

In this section production rules for entire C language is written. The grammar productions does the syntax analysis of the source code. When a complete statement with proper syntax is matched by the parser. Along with rules semantic actions associated with the rules are also written and corresponding functions are called to do the necessary actions.

C-Program Section

In this section the parser links the extern functions, variables declared in the lexer, external files generated by the lexer etc. The main function takes the input source code file and prints the final symbol table.

To run the program, open the terminal in the folder and type

./run.sh

The 5 cases which were given in assignment on which the semantic analysis was to be performed are tested on

- **Test Case 6** Cannot use reserved keyword/ identifier
- **Test Case 17** Arithmetic operations requires integers
- Test Case 14

 New declarations does not conflict with earlier ones
- Test Case 10

 Break and continue statements appear only inside loops
- **Test Case 12** Actual and formal parameters types need to be compatible.

The input for each test case is given with its corresponding output.

We have printed a symbol table and a constant table in case a program does not have a semantic error.

For test cases having semantic error, appropriate error message is displayed along with error line number.

The programs are written and tested on Ubuntu 18.04

Test Cases

Test Case 1

I/P program

Output – PASS

```

29 | Number Constant
0 | Number Constant
```

Test Case 9 -

```
C test9.c>...
1    // Implicit Error that our Language doesn't support
2
3    #include<stdio.h>
4
5    int main() {
6         char @hello;
7         @hello = 'c';
8    }
9
```

Output – Failed

Test Case 10 –

Input -

```
C test10.c > ...
1  #include <stdio.h>
2  int main()
3  {
4     int i;
5     for(i=0;i<5;i++)
6     {
7         if(i==3){
8         }
9     }
10     continue;
11  }
12</pre>
```

Output – Failed

Continue outside for loop

Test Case 11 –

Input -

```
#include<stdio.h>
     int square(int a, int b)
     {
         int b = 2;
         return b;
    int main()
     {
         int num = 2;
         int num2;
11
12
         square(num, num);
13
14
15
         return 0;
17
```

Output – Failed

Test Case 12 –

Input -

Output – Failed

Since we have passed an int from main but used char in function.

Test Case 13 –

Input -

Output – Failed

Test Case 14 –

```
C test14.c > ② main()
1
2  #include<stdio.h>
3
4  void main()
5  {
6    int i,n;
7    i = 10;
8    int i = 15;
9
10 }
11
```

Output – Failed

Since we have declared same variable twice. This gives an error. New declaration conflicted with earlier ones.

Test Case 15 –

Input -

```
C test15.c > ...
1     #include<stdio.h>
2
3     int myfunc(int a)
4     {
5         return a;
6     }
7
8     void main()
9     {
10         int i,n;
11
12         myfunc(i,n);
13
14    }
```

Output – Failed

Number of parameters does not match

Test Case 16-

Input -

```
C test16.c > ...
1  #include<stdio.h>
2
3  void main()
4  {
5     int i=3,n=6;
6     float a=0.0;
7     a = i+n;
8  }
9
```

Output -

Since we are performing arithmetic operations on two different data types. Data type mismatch.

Test Case 17 –

Input -

Output – Failed

Test Case 18 –

Output – Passed
